

CASE STUDY

STELCOR DDMS TOUCHING DOWN AT JFK AIRPORT

DESIGN LOADS:

70 Tons Compression
25 Tons Tension
4 Tons Lateral

PILE DETAIL:

STELCOR 1600
18" Drive Plate
16" Corrugated Grout Column
11" Reverse Grout Auger
7.00" O.D. X 0.408" W.T. – 80 ksi
Central Shaft

PILE LENGTH: 60'

NUMBER OF PILES: 178

GEOLOGY:

Subsurface explorations at this site encountered a layer of hydraulic fill, marsh deposits, and sands. The upper layer of hydraulic fill ranged from 3-14 feet deep and was underlain by native marsh deposits consisting of gray organic clay and peat. Glacially deposited medium-grained sands extended from the marsh deposit layer to where borings were terminated at 102' and ranged from loose to medium dense.

OVERVIEW:

Another successful STELCOR install at JFK Airport in New York City. This time around, we had the opportunity to provide a deep foundation solution for the expansion of the terminal 4 headhouse. In layman's terms, the part of the airport where you get tickets, drop off baggage, stand in long lines, or wait for bags that may or may not arrive. The terminal 4 project results from the partnership between Delta airlines and PANYNJ, the Port Authority of New York and New Jersey. The \$1.5 billion transformation will allow Delta airlines to consolidate its operations at JFK into one terminal while also updating and expanding its current facilities. The expansion will include additional self-serve kiosks and updates to the baggage claim and arrival areas. In addition to the changes in the headhouse, there will also be ten new gates and additional seating added to the terminal. The renovations and expansion are scheduled to be completed in 2023.

THE PROCEDURE C TESTS ATTEMPTED TO REACH PILE FAILURE BY APPLYING 300% OF THE DESIGNED LOAD. EVEN AT THE MAX LOAD OF 225 TONS IN COMPRESSION, THE PILE TOP DISPLACEMENT WAS JUST OVER 1/2".

Load Test Results	Max Applied Load(Tons)	Pile Top Displacement at Max Applied Load(in)	Net Pile Settlement(in)
Compression B	170	.376	.135
Compression C	255	.504	.084
Tension B	52.7	.104	.008
Tension C	75	.190	.071
Lateral B	8.3	.508	.151
Lateral C	12	.756	.158

CASE STUDY

STELCOR DDMS TOUCHING DOWN AT JFK AIRPORT

CHALLENGES:

The most significant challenge on this site was the headroom restrictions. The headhouse expansion extends under the existing elevated 4-lane departures roadway and the parallel AirTrain. The majority of the piles were to be installed under the roadway, and a few were required under the Airtrain. Both the overpass and AirTrain had to remain operational during the installation. With as little as 12 feet of overhead clearance in areas, traditional driven pile methods were deemed unsafe to install.

Equipment necessary needed to be compact as there was limited site space. The restricted site space also created concerns about managing spoils. Spoils would have to be contained and then trucked away from the site, which would be costly and time-consuming. Lastly, vibrations from installation also need to be considered due to the surrounding structures.

SOLUTION:

Drilled displacement micropiles were specified for this project by ARUP. DDMS were specified as they worked well within the confines of the project and could be installed with relatively minimal and readily available construction equipment. The ease and speed of installation, even with the overhead restrictions, was another advantage of using STELCOR for this project. A further advantage was the vibrationless installation which would not disrupt the surrounding properties or utilities. Using a displacement pile also saved time and money by eliminating spoils. With the above elements considered, STELCOR DDMS proved the ideal solution for supporting the headhouse expansion.

A STELCOR SC1600 pile was designed to resist the required 70 tons in compression, 25 tons in tension, and 4 tons in lateral. It was then tested to 255 tons in compression, 75 tons in tension, and 12 tons in lateral and passed with flying colors. The Procedure C tests attempted to reach pile failure by applying 300% of the design load. Even at the max load of 225 tons in compression, the pile top displacement was just over 1/2". STELCOR was approved by the Port Authority of New York and New Jersey. Urban Foundation/Engineering, LLC, a certified STELCOR installer, was contracted to perform the Deep foundation installation. In total, 178 STELCOR piles were installed to 60 feet, and the AirTrains remained fully operational throughout the project.

THE HEADHOUSE EXPANSION EXTENDS UNDER THE EXISTING ELEVATED 4-LANE DEPARTURES ROADWAY AND THE PARALLEL AIRTRAIN, BOTH OF WHICH HAD TO REMAIN OPERATIONAL DURING INSTALLATION.

KEY TO ROCK CORE LOGS

Fracture Spacing

Crushed	less than ¼ inch (may be clayey)
Intensely Fractured	¼ to ¾ inch
Very Closely Fractured	¾ inch to 2.5 inches
Closely Fractured	2.5 to 8 inches
Medium Fractured	8 inches to 2 feet
Widely Fractured	2 to 6 feet
Very Widely Fractured	greater than 6 feet

Bedding Spacing

Laminated	less than ½ inch
Very Thin Bedded	½ to 1 inch
Thin Bedded	1 to 4 inches
Medium Bedded	4 to 12 inches
Thick Bedded	1 to 3 feet
Very Thick Bedded	3 to 10 feet
Massive	greater than 10 feet

Hardness

Friable	Easily crumbled, or deformed by hand if plastic; can cut through core with knife
Low Hardness	Can be gouged deeply and carved with knife; dull thud when struck with hammer
Moderately Hard	Can be scratched, and gouged with difficulty, with knife
Hard	Can be scratched by knife only with considerable effort
Very Hard	Cannot be scratched with knife; streak of knife metal left on core; sharp ring when struck

**ROCK CLASSIFICATION CHART
AND KEY TO DATA AND SYMBOLS**

ARUP

INDEXED ROCK CLASSIFICATION (CONT.)

KEY TO ROCK CORE LOGS (CONT.)

Strength

Plastic	Can be deformed or molded by hand; usually very clayey
Very Weak*	Can be crumbled by hand and easily pulverized with hammer; commonly crushed, sheared, or severely weathered
Weak	Outcrop would crumble under light hammer blows; core (2-inch + diameter) can be broken by hand; does not qualify for RQD
Moderately Strong	Several firm hammer blows required to break outcrop; core cannot be broken by hand but will generally break with a single light hammer blow; qualifies for RQD
Strong	Outcrop can be broken by several heavy hammer blows and will yield larger fragments; core usually breaks with single strong hammer blow
Very Strong	Many heavy hammer blows required to chip outcrop or produce only small fragments; several strong hammer blows may be required to break core

* This strength category was referred to as "friable" on the 2003 boring logs, and was changed to "very weak" on the 2005 logs for the purpose of not confusing "friable" strength with "friable" hardness; both "friable" strength and "friable" hardness are categories used on the 2003 logs.

Weathering

Severely Weathered	Very heavily Fe (iron oxide) stained throughout the rock mass and along fractures; usually significantly weakened as compared to fresh condition; can be soil-like but with recognizable rock fabric
Moderately Weathered	Considerable Fe-staining within the rock mass and on fracture surfaces, but less weakened
Slightly Weathered	Little or no Fe-staining within the rock mass, with stains limited to fracture surfaces; the rock mass is not noticeably weakened
Fresh	No Fe-staining within the rock mass or along fractures

Fracture Frequency

The average number of fractures per foot within the specified interval (excluding mechanical breaks). CR indicates crushed intervals, with fracture spacing less than ¼ inch and usually some amount of clay. "+" suggests some greater amount of fracturing beyond the indicated minimum number of natural core breaks (e.g., "10+"), due either to the presence of variably healed microfractures (typically tension cracks) that are common within Franciscan Complex rock units, or to some uncertainty that exists because of possible mechanical breakage.

RQD - Rock Quality Designation

The percent of each run recovered as intact lengths of sound rock core greater than 4 inches, between naturally-occurring fractures and measured along the core centerline. N/A indicates that none of the run meets the soundness criteria, and thus RQD is not applicable for the entire run length.

% Recovery

The length of recovered core divided by the length of the run, expressed as a percentage.

Drill Rate

The time required to core the run, in minutes, divided by the length of the run, in feet.

Field Notes

Notes on drilling characteristics and problems, core losses, etc.
